

Test A — Domain 01 Backend/API Acceptance Report

FarmOS development backend | Docker verification | API Contract v2.2 | 16 September 2026

Acceptance summary — question left, result right

Test	Acceptance question	Result
A01	Register a new user, create an organization with only Organization Name + Country + State/Region, confirm Industry is neither required nor rejected incorrectly, verify the creator becomes Organization Owner without a staff assignment, create two farms, and prove the Owner can access both.	PASS
A02	Create a fresh organization and verify Farm Manager, Veterinarian and Field Worker templates are available with their approved default capabilities. Confirm Organization Owner is not an editable staff role. Edit a template permissions and verify the effective permission set changes without changing the role identity. Create a custom role and verify it behaves through capabilities.	PASS
A03	Test active login, invalid password, unknown user, deactivated account and unauthenticated protected request. Verify /users/me/ and /users/me/capabilities/ return authoritative identity/access context after authentication.	PASS
A04	For selected protected operations, test one user with the required capability and one without it. PASS only if authorization is based on capability + scope rather than role name.	PASS*
A05	Assign staff Role + Farm, change Role, change Farm and revoke assignment. Verify old authority stops applying, historical assignment survives and a user with no active assignment becomes Unassigned Staff rather than being deleted.	PASS
A06	Test Owner Web, Owner Mobile, Manager Web/Mobile, Veterinarian Web/Mobile and Field Worker Web/Mobile. Field Worker Web denial must return the agreed stable channel outcome rather than depend solely on frontend hiding the application.	PASS
A07	Deactivate an actively logged-in staff user. Existing session next protected request must fail; fresh login must fail; profile/history remain. Reactivate and confirm login eligibility returns but revoked assignments are not recreated.	PASS
A08	Expire access session with valid renewal state; verify renewal and retry. Then test invalid/expired renewal and deactivated account. PASS only if deactivation cannot be bypassed through refresh. Identify the actual endpoint/mechanism for the contract.	PASS*
A09	Login, access a protected API, logout, and call the protected API using the terminated session. It must fail. Login again and confirm the account itself remains active.	PASS
A10	From Organization A attempt to retrieve/search Organization B user, role, farm and assignment using known IDs and search values. Any unauthorized disclosure is a release blocker.	PASS*
A11	Farm A-only staff attempts Farm B list/detail/write operations using known IDs and direct API calls. Any Farm B record returned or mutation accepted is a release blocker.	PASS*
A12	Perform organization creation, assignment create/change/revoke, role permission update, deactivate/reactivate and authentication/security actions. Verify actor, target, organization/farm context, timestamp, result and before/after where required. No credentials/tokens may appear.	PASS*
A13	Trigger Authentication Required, Session Expired, Account Deactivated, Permission Denied, Farm Access Denied, Channel Access Denied, Validation Error and Conflict scenarios. Verify stable machine-readable codes and standard response structure.	PASS*

Test	Acceptance question	Result
A14	Retry sensitive writes using the same idempotency identifier where applicable. Verify one authoritative side effect rather than duplicate organizations, farms, tasks, or other records.	QUALIFIED PASS

Automated tests: 38 passed | Account/API E2E checks: 27 passed | Failures: 0

A14 — Mutation / Idempotency Detail

Mutation scenario	Result
Organization creation retry	PASS
Task creation retry	PASS
Task completion retry	PASS
Farm creation retry	PASS
Invitation retry	PASS
Assignment retry	PASS
Failed mutation retry	PASS
Concurrent duplicate requests	NOT DIRECTLY TESTED

Release disposition: Implemented baseline — pending concurrent-request coverage and joint QA.
